Abstract (en)
[origin: EP0624433A1] The invention relates to pliers, in particular for circlips (securing rings), having two pliers halves (1,2) which are pivotably interconnected via a single joint and are in each case constructed at one end in the form of a handle and equipped at the other end with a functional element (4) constructed in accordance with the particular application. In order to develop pliers of the type described at the beginning such that they are less expensive to produce while at the same time having an insulating action and being lighter than the known pliers, it is proposed that the pliers halves (1,2) are made of plastic and the functional element (4) is moulded into the end of the pliers halves (1,2). <IMAGE>
