Abstract (en)

[origin: EP0624526A2] Closures are known, which only permit the contents of the container to be squeezed out in an unsatisfactory manner and are furthermore of relatively complex design and therefore expensive to manufacture. The object of the invention, in addition to cost-effective manufacture, is also to permit the contents to be squeezed out of the container in an optimum manner. For this purpose, provision is made for the lid part (5) to consist of a material of high elasticity and to be firmly connected to a supporting body (4) which is formed from a material of less elasticity and is otherwise joined to the neck of the bottle (1) or to the closure (2). <IMAGE>
