Abstract (en)

According to the present invention a list of fields is displayed on a display like a TV screen. Each field corresponds to a given time period, like an hour, a day, a week, or the like. Control-times which are input by a user via an according input device, are displayed in that field, time period of which includes said control-time. In a preferred embodiment the fields are arranged such that the first field of this list corresponds a given time period, e.g. of a current hour, a current day, like today, a day before or the like. The list can be designed e.g. as a calendar with a number of fields, each for one day. Inside each of these fields a sub-list can be generated which gives an overview of programmed times of the according day. <IMAGE>
