Abstract (en)

In a device for manufacturing bricks from clay, a continuous strand (2) of clay is formed by a pressure nozzle (1) connecting onto a supply holder. Portions are severed from the strand by means of a cutting member. It occurs in practice that, subject to the composition of the clay, the strand of clay (2) coming out of the pressure nozzle (1) breaks off spontaneously. According to the invention this is avoided by having a funnel-like part (11) connect onto the pressure nozzle (1). <IMAGE>
