Abstract (en)

[origin: EP0626336A1] The invention relates to a procedure for adjusting the inclination and direction of travel of a rail wheel (1) of a crane. The bearing surfaces (8a and 8b) guiding the eccentric bearing bushes (2a and 2b) are so placed that they have the same eccentricity relative to the centre line of the shaft (6) as the journal boxes 3a and 3b, and the eccentricity has to be so chosen that the desired direction adjustment can be accomplished with a sufficiently small angle of rotation. <IMAGE>
