Abstract (en)

An apparatus for carrying out a physical and/or chemical process, such as a heat exchanger, comprising a reservoir provided with upwardly-directed tubes, which tubes are in open communication with a top box and a bottom box, in which bottom box at least one distribution plate is arranged for supporting a fluidized bed consisting of granular material. The invention further comprises means for feeding fluidized bed particles back from the top box to the bottom box. At the bottom end, the bottom box is provided with a bottom pot (6) having a deepened bottom (9) for collecting thereon pollutions from the main flow fed via a feed line (5, 5A) laterally extending into the bottom pot (6), the collected pollutions being removable from the bottom pot (6) by means of a conduit system (10, 14) which discharges a portion of the main flow. <IMAGE>
