Abstract (en)

[origin: EP0627319A1] A method for printing by thermal sublimation is provided, comprising the steps of: 1) supplying uncorrected input data  $l_i,u$  to a processing unit of a printer having a head with a plurality of heating elements; 2) obtaining density correction means  $M_{i,d}$  for improving across-the-head unevenness according to the steps of: a) activating each heating element with power compensated input data, so that a same time-averaged power is generated in each heating element; b) measuring the printing density of pixels; c) estimating for each heating element the deviation delta  $i$  of the density from a density aimed at by applying said power; d) calculating for each heating element a density correction means  $M_{i,d}$  taking into account said deviation delta  $i$ ; e) storing each of said density correction means  $M_{i,d}$ ; 3) combining the respective uncorrected input data  $l_i,u$  with the respective density correction means  $M_{i,d}$ ; 4) providing the thus corrected data to the thermal head. <IMAGE>
