Abstract (en)

In an openable window frame of the type where a pane (6) is fixed between an external frame member (1) and an internal glazing bead (8), a pasquil operating device with a rotary handle (22) for actuating a latch bar (15) via a transmission device (30) between opening and closing positions and latch members (37) for engagement with a striking plate (18) on the corresponding main frame member (20) is received in its entirety in the glazing bead (8). The transmission device comprises a single coupling link (30) between a coupling arm (28) connected with the rotary handle and a laterally displaced point on the latch bar (15). At the assembly, the latch bar (15) and the latch members (37) are arranged in a U-shaped portion (9) of the glazing bead (8), while the operating handle (22) is mounted between two plate members (24, 25) which are retained in the glazing bead (8). <IMAGE>
