Abstract (en)

[origin: EP0628348A2] The invention relates to a regulating device for the entry section of a vertical pulveriser for optimised pulveriser utilisation and for reducing dust in vertical pulverisers. In order to prevent unnecessary air from being drawn in by the vertical pulveriser and leading to the development of dust, the entry opening 2 of the pulveriser is always closed by material located in the receiving container 1, and therefore no unnecessary air is drawn in by the pulveriser and therefore does not lead to the development of dust. <IMAGE>
