Abstract (en)  
[origin: EP0631022A2] The invention discloses a free-standing carcass unit or system-built structural unit, as three-dimensional body for constructing single-storey or multiple-storey building structures from a multiplicity of such three-dimensional bodies, each three-dimensional body being made up to prefabricated compound elements which each form a two-hinged frame in the longitudinal direction and a three-hinged frame in the transverse direction. The three-hinged frame can be transferred into a two-hinged frame by positive or frictional locking. Advantageously, the two prefabricated compound elements are produced together from concrete in such a manner that, after their manufacture, they can be separated for transportation and/or for storage, can be connected once again on site for constructing the building structure, and can be separated once again for dismantling the building structure in order then, if appropriate, to be used in a corresponding manner for constructing another building structure. <IMAGE>
