Abstract (en)

Cooling unit for coffins comprising a refrigerating circuit in which a first heat exchange fluid circulates therein and a second circuit in which a second heat exchange fluid circulates, connected with a refrigerating plate in a condition of heat exchange with the coffin. The plate is of disposable kind i.e. detachable from the remaining of the cooling unit and left into the coffin after the final closure thereof. Means are also provided to allow the draining of the heat exchange fluid from the refrigerating plate and the recovery of said fluid in a suitable tank to allow the reuse of the remaining part of the cooling unit by insertion of other plates. <IMAGE>
