Abstract (en)  
In a video reproducing apparatus for reproducing compressed video information at a predetermined period irrespective of a reproducing processing ability, a frame skip is reduced. A moving image is alternately intraframe coded and interframe coded every frame. As a header of coding information, ID information indicative of a compression coding method is included. Upon reproduction, when the apparatus is not in time for reproduction display, a decoding process up to the process just before the intraframe coded frame which is located at the latter position with respect to the time is skipped with reference to the header. <IMAGE>
