Abstract (en)
A dishwashing machine is described, comprising a washing chamber (3) wherein at least a crockery basket (4) is housed to which a vertical tubular element (9) is associated, the upper end of said vertical tubular element (9) being able to receive a liquid flow exiting the end of a conduit (11) coming from a pump (6), said end of said conduit (11) being upstream, substantially coaxial and at a certain distance from said vertical tubular element (9), and the lower end of said vertical tubular element (9) being connected to a spraying organ (8), in particular rotatable around the axis of said vertical tubular element (9). The main feature of the described dishwashing machine consists in the fact in the internal upper wall (3A) of said washing chamber (3), in correspondence of said end of said conduit (11), a terminal element (10) is provided having variable length, which, when said spraying organ (8) is supplied with liquid in pressure coming from said pump (6) through said conduit (11), lengthens downwards in the way of eliminating the distance existing between said end of said conduit (11) and said vertical tubular element (9). <IMAGE>
