Abstract (en)
[origin: EP0633197A1] The invention relates to an assembly of a container and a closure, the said container having a head comprising a neck extended by a shoulder (10) which connects this neck with a body or with a skirt, the said closure and the said head respectively having complementary means (12, 14 and 15) of locking in relative position by rotation, characterised in that these means respectively consist of an elastically flexible axial blade (12) carried by the closure and of profiled axial portions (14 and 15) carried by the said shoulder (10), these portions comprising a first portion (14) for the clip-in engagement and retention of the said blade (12) and a second portion (15) which is a stop-piece for the blade (12) ensuring its retention by the first portion (14). The invention applies to the manufacture and industrial closure of containers having clip-on or screw-type closures which must be oriented accurately with respect to a decoration or to the geometry of these containers. <IMAGE>
