Abstract (en)
[origin: EP0633204A1] 2.1 In the case of a refuse container having a refuse-container body on the upper edge of the front wall of which there is integrally moulded a suspension strip which delimits a downwardly open receiving hollow into which a chip holder capable of being equipped with a data carrier is arranged, it is to be achieved in a simple way that not only newly manufactured refuse containers but also those already in use can be retrofitted with a data carrier in the form of a chip. 2.2 According to the invention, the chip holder (16) comprises a profiled body (18) which is fitted, in closing fashion, into an insertion opening (15) of a leg (13) of the suspension rail (11), the leg being situated parallel or approximately parallel to the front wall of the refuse-container body. Integrally moulded on the chip holder (16) is at least one snap element in the form of a spring web (22, 23), the free end of which grips internally behind the edge delimiting the insertion opening (15). The profiled body (18) is additionally provided with a covering flange which bears externally on the edge delimiting the insertion opening (15). 2.3 The refuse container according to the invention is usable especially for domestic purposes. <IMAGE>
