Abstract (en)

[origin: EP0633370A1] The profile section includes a bearing central body and several superposed sets of two lateral wings which are symmetric to one another relative to the bearing central body. According to the invention, the bearing central body is a solid body (2) duplicated at the bottom in the shape of a fork, the two legs (6, 7) of which are symmetric relative to the plane (AA') passing through the top part of the said solid body; the profile section further comprises: a) at least four sets of two wings, two (9, 10) in the region of the top part and two (11, 12) in the region of the duplicated bottom part of the central body, b) two lateral hollow bodies (14a, 14b) of a single piece with the central body, each being respectively formed of the two superposed wings (10a, 11a) of the two middle sets (10, 11) and a joining face (13a) connecting the ends of the two said wings. Application: producing removable roofing structures, and more particularly roofing structures for pools where the roof can be opened up. <IMAGE>
