Abstract (en)
[origin: EP0633378A2] The invention relates to an espagnolette lock which is blocked against return, as a result of gear play, by means of a blocking member cooperating with an espagnolette connecting slide and with a rotatable gear element belonging to an espagnolette-actuating gear. In order to develop the lock advantageously in terms of production and use, an arrangement of the blocking member (10) between the paths of movement of a control cam (7', 1') assigned respectively to the connecting slide (7) and to the gear element (1) is provided. Preferably, the blocking member (10) is to be in sliding bearing contact with the control cam (7') of the connecting slide by means of a first blocking nose (18') and in sliding bearing contact by means of a second blocking nose (19') with a control cam (1') formed by a circumferential surface of the rotatable gear element (1).
