Abstract (en)

[origin: WO9320306A1] An elongate tension - and pressure - absorbing construction component (11) for use in scaffolds, comprises a tension-absorbing core piece and a succession of axially impacting, sleeve-shaped sections (16) and sleeve-carrying sections (17). The sections surround and form support abutments against the core piece (15). A pair of tension means (18a, 18b) are arranged at their respective ends of the core piece (15) and form stops for the succession of sections (16, 17). The pressure-absorbing sections (16, 17) are axially set up on the tension-absorbing core piece (15) with a certain tensile force between the pair of tension means (18a, 18b).
