Abstract (en)  
[origin: EP0634541A1] In the case of a travelling mechanism (running gear) (1) for an extension arm (5) of a gondola (6), which is supported displaceably on a guide rail (4) by means of rollers (36, 37), the travelling mechanism (1) comprises a travelling-mechanism support (21) for the extension arm (5) and two or more U-shaped brackets (31) which engage over the guide rail (4). Furthermore, the brackets (31) are connected rotatably to the travelling-mechanism support (21) and are provided with the rollers (36, 37). By means of this configuration, it is possible to lay the guide rail (4) directly on the roof surface (3) of a building (2), and the guide rail (4) may also be arranged in an arcuate manner. By virtue of the articulated connection of the brackets (31) to the travelling-mechanism support (21), the travelling mechanism (1) can, in fact, turn curves without any lateral displacement movements of the rollers (36, 37) taking place. <IMAGE>
