Abstract (en)

[origin: EP0635229A1] There is described a barrier, especially for stadium stands and halls in which events are staged, comprising a barrier arrangement (10) which has at least two substantially vertically running brace elements (11a, 11b) which can be anchored by their bottom end (11a', 11b') in a foundation (2) and which are connected in their upper region by at least one cross-brace element (12, 12a). According to the invention, provision is made for a seat arrangement (20) having at least one seat (20') to be receivable in the barrier arrangement (10), for the seat (20') to be pivotable from a first position in which it is disposed substantially orthogonally to a plane defined by the brace elements (11a, 11b, 12) of the barrier arrangement (10), into a second position in which the seat (20') is disposed substantially in the plane defined by the strut elements (11a, 11b, 12) of the barrier arrangement (10), and for the seat (20') to be lockable in this second position by a latching device (14). <IMAGE>
