Abstract (en)
An anti-(after)drip device at the outflow pipe of a dosing device, in particular a beverage machine, wherein, in a first outflow path (1) of the outflow pipe, a branch (3, 16) is provided for a second outflow path (13) having a direction which is different from that of the first outflow path and slants downwards, which branch can be bridged by the liquid at a relatively high flow velocity, whereas at decreasing flow velocity the residual liquid follows the second outflow path (13) through the branch (3, 16). <IMAGE>
