Abstract (en)

[origin: EP0636426A1] A device for cleaning preferably metallic workpieces, in particular for removing solid and/or liquid residues such as sand, chips, lubricant or the like has an immersion container (10) for a washing liquid (16) and a receiving device (20) for the workpieces (1) to be cleaned, the receiving device (20) being rotatable about an axis of rotation. The receiving device (20) can be pivoted about an essentially horizontal pivoting axis (25) running above the immersion container between two positions, the first of which arranges the receiving device (20) above the liquid level (15) in the immersion container (Fig. 1) and the second of which arranges the receiving device in the immersion container with an essentially vertically running axis of rotation (Fig. 2). <IMAGE>
