Abstract (en)  
[origin: EP0636765A1] Turbo machine including a single-piece rotor (26) which has to be ventilated by gas at some other temperature. The ventilation system, adjacent to the flow stream (5) of the propulsion gases is sufficiently separated from this stream, without a material seal, if the ventilation duct (7) is divided into an internal main duct (21) and an external duct (22) in which the ventilation gas is accelerated in order to form an entrainment jacket which the gas in the other duct can not get through. Application to aircraft engines. <IMAGE>
