Abstract (en)  
[origin: WO9322870A1] This invention, called an Information Router, holds a microprocessor-based control unit that is designed to be able to connect to one or more computers, a telephone, one or more telephone lines and one or more printers. The control unit has a built-in, afterwards added and/or the ability to attach an external, document scanner (14) and it can also be equipped with an internal data- and fax-modem (3). The Information Router can help attached external units to be used selectively for copying from scanner to printer, for receiving incoming and sending outgoing telefaxes and to print out and input data to/from an attached external computer.
