Abstract (en)

[origin: EP0638775A1] This process consists of making the opening cross-section (2) subject to, on the one hand and mainly, the difference between the quantity of water vapour contained in the air of the room (Vi) and the quantity of water vapour in the outside air (Ve), so that the opening cross-section increases when this difference increases, and, on the other hand, in an independent manner, to the quantity of water vapour in the outside air. Application to the ventilation of rooms. <IMAGE>
