Abstract (en)  
[origin: EP0639393A1] The invention relates to an alpine ski binding component comprising the following parts: a base (3), a body (2), a jaw (4) for holding the boot, and an energy spring (15) housed inside the body. The component is characterised in that the supporting plate (26) can move for a rolling movement, and in that connection means (40, 50, 54, 58) sensitive to the rolling movements of the supporting plate connect the supporting plate to at least one of the movable parts of the binding component, so as to reduce the opposing force which the boot must overcome in order to be released laterally by the jaw, and then to cause the jaw to swing freely beyond a rolling movement of given amplitude produced by the supporting plate. <IMAGE>
