Abstract (en)

[origin: EP0640557A1] The invention relates to a device for supplying fuel to motor vehicles, having a plurality of hoses (4) which are each provided with a fuel-pump nozzle (3) and, for filling the tanks of the vehicles, can be drawn out of the housing (1) counter to a return force, for which purpose each hose (4), fastened in the housing (1) by one end, is guided at least over one roller (2) fitted in the housing (1). In order to reduce the structural outlay in order to generate the return force, the invention proposes that all the hoses (4), for generating their return force, be connected to a common force generator (10, 11). <IMAGE>
