Abstract (en)

[origin: EP0641905A1] The invention relates to a shuttering board which consists of an essentially rigid basic material and is intended, for example, for clearances in a wall or ceiling region of concrete structural parts. In order to form clearances or the like, such shuttering boards have to be sawn to size and then nailed together. This is expensive and can result in inaccuracies. The invention solves this problem in that the shuttering board is produced from a brittle material which can be bent at prefabricated predetermined bending points (6, 7, 12, 19, 20), a deformable and bendable reinforcement (2, 3, 10) which is integrated in the shuttering board then holding the bent parts together in the desired manner. <IMAGE>
