Abstract (en)
[origin: DE4331254C1] The present invention relates to a trough bridge having a level roadway (floor) and upwardly constructed sidewalls (SW), at the upper ends of which the top flanges (OG) are arranged. The bridge is divided along the roadway into as many modules (B) as desired, the length of which can be adapted to the transporting length available. The individual bridge modules (B) can be nested into one another, resulting in a stack with very low transporting height. <IMAGE>
