Abstract (en)

[origin: EP0643181A1] The invention relates to a profile part (1) with a claw (9) arranged displaceably in sliding grooves and intended for fastening wall and/or ceiling elements of a facing shuttering. In order largely to prevent bracing and displacement of the wall and/or ceiling elements, the claw (9) exhibits a lug-like extension (14) which, for fixing the claw (9) on the profile part (1), can be bent over at least in the region of a sliding groove (7) with the result that the corresponding region (17) of the extension (14) presses at least against one leg (21) of the sliding groove (7). This means that the wall and/or ceiling elements can be secured, in certain areas, in the given assembly position and subsequent displacement or bracing of said elements is ruled out. <IMAGE>
