Abstract (en)

A drive and securing device for the window glass in automobile vehicles, with a support part (A) which is in turn a guide in the track (B) and a support for the glass (C). This support (A) has an upper U-shaped portion with two facing projections (9) and (10) with their divergent faces downwards. The upper straight portion of the projection (9) includes a pivot (3) which is housed in the hole (2) in the glass and is offset in relation to the front of the projection (10). The advantage of the invention is that it is easy to assemble the glass onto the support and also to dismantle it. <IMAGE>
