Abstract (en)

[origin: EP0643254A1] The reservoir (container) for storing gas under high pressure includes a casing part (2B) which is not insulated, and a casing part (2A) which is insulated, the two parts (2A, 2B) being connected by an insulated passage (18) insulated from the casing parts, the non-insulated part (2B) defining a gaseous overhead (ceiling) making it possible to limit instantaneous pressure drops when liquid in the insulated part (2A) is being drawn off continuously in order to alleviate the response time of an external heating circuit for maintaining the pressure. Application particularly to the back-up installations of a primary source for producing high-pressure gas. <IMAGE>
