Abstract (en)
[origin: WO9325440A1] The invention concerns a sweet-conveyer device with, rotating about a stationary central spindle (8), a gripper wheel (1) having a housing (7) with a multiplicity of cam-controlled pivoting pairs (3) of grippers designed to pick up sweets (B) cut off a continuous extrusion by a cutter and transfer them to a transfer wheel (6). The grippers (22, 27) of each pair (3) are mounted so that they can pivot longitudinally relative to each other and together. The invention calls for the pivot axis (X) of a gripper-pair pivot-drive transmission device and the pivot axis (Y) for the grippers (22, 27) of each pair (3) to be located on an arc (K) of a circle at the same radius of rotation (R) with respect to the stationary central spindle (8) which acts as the centre of the pivoting motion. The invention also calls for the relative position of one pivot axis (X) with respect to the other pivot axis (Y) to be adjustable on the arc (K).
