Abstract (en)

[origin: WO9323636A1] The invention discloses a system for fixing slats (20), made of wood or similar material, and forming particularly a floor. The system allows to fix the slats (20) in a juxtaposed arrangement without damaging the slats owing to the use of tongues (10) wherein bearing elements (12) provided with teeth have been swaged. Said tongues (10) are placed on the subfloor (11) and are either fixed directly or held in place by gravity by means of flexible rubber supports (8) and of alignment slats (70) which maintain them at equal distance with respect to each other, thus without causing any damage to the subfloor (11). This fixing system provides for an easy installation and dismounting of slats (20) and is particularly appropriate for prevarnished wooden slats (20).
