Abstract (en)

[origin: DE4216421A1] A locking system is composed of a lock and several keys. Closure of the lock is determined by magnetically controlled tumblers and it can be modified so as to respond to the code of a subsequent key by displacement of at least one tumbler element within the lock. In order to obtain a particularly reliable and advantageous design, the tumbler element (33, 33') is designed as an adjusting element associated to the code conversion magnets (42, 43, 44, 45, 46, 48, 49), so that the tumbler insertion opening (40, 50, 51) for the code conversion magnet can be moved out of alignment with the code conversion magnet.
