Abstract (en)

[origin: EP0645483A1] The feeding-in device, which comprises a holding device, a number of feed bars (23) and drive devices (24), is designed as a constructional unit and can be brought into and out of operative connection with a weaving rotor of a linear-shed weaving loom. For this purpose, the weaving loom has a mounting arrangement for receiving the feeding-in device. The outlay for changing the articles on the weaving loom is thereby reduced. <IMAGE>
