Abstract (en)  
[origin: EP0645511A1] The lock comprises a locking pawl (1) articulated on a shaft (2) and, in the locking position, capable of retaining a bolt (4) cooperating with a keeper (9); the lock comprises means (E) for driving the pawl (1) which are capable of retracting it in order to release the bolt (4) and allow the door to be opened, the said lock comprising, furthermore, electrical control means (24) for ensuring extra security by rendering the drive means (E) ineffective on the pawl and by preventing the opening of the lock from inside the vehicle, particularly by action on a fascia pull or equivalent member. The means (E) for driving the pawl comprise an arm (10) pivoting about the shaft (2) of the pawl, with a possibility of translational movement between an active position, in which this arm can control the rotation of the pawl (1), and an inactive position, in which this arm (10) is ineffective on the pawl (1), the change of the arm (10) from the active position to the inactive position being ensured by the extra-security electrical control means (24). <IMAGE>
