Abstract (en)
An electromagnetic detection system comprising a transmitter and receiver device, a transformer having a primary side which is connected with the transmitter and receiver device, at least one antenna element which is connected with a secondary side of the transformer for generating an electromagnetic interrogation field in a detection zone and at least one responder adapted to radiate a detection signal under the influence of the interrogation field, the antenna element consisting of a current loop having only one winding. The system further comprises a tuning element which is connected with the secondary side of the transformer and with the antenna element, so that on the secondary side of the transformer a resonance circuit is formed having a resonance frequency which corresponds with the operating frequency of the transmitter and receiver device. <IMAGE>
