Abstract (en)

[origin: WO9400712A1] A transportable container (10) for carrying refrigerated products in frozen or refrigerated temperatures includes a structural container having an insulated outer shell with an access doorway (21). The upper portion of the container (10) includes a transverse perforated baffle (25) and positioned above the baffle (25) are a pair of spaced apart canisters (27, 28) containing liquid refrigerant. A gas or liquid feeder tube (32) penetrates each bottle (27, 28) and communicates with an on/off valve (30, 31). A feeder tube (32) can draw liquid to dispense for cooling, or it can release gas and pressure within the canister to boil the CO₂. When CO₂ reaches its boiling point, the canister (27, 28), its bracket, and the cold plate reach very cold temperatures to cool the cargo area. The gas is released through copper tubing over the cold plate to act as method for convection.
