Abstract (en)

[origin: WO9425849A1] The invention concerns a device for the measurement of the reflectance of small areas of solid, liquids or gases in several regions of the spectrum (visible, near IR, medium IR), it being possible to determine the surface distribution of the spectral reflectance and/or perceived colour. The invention proposes that special concentrators are disposed behind the individual radiation sources, thus making it possible, without the need for sophisticated design or adjustment measures and with only low radiation losses, to concentrate the radiation on a very small area of the surface under examination.
