Abstract (en)

A thermal printhead (26) having a plurality of from a power supply (32). The current is directed to selected ones of a plurality of resistive heat elements (44-1...44-N) in response to a sequence of data bits corresponding to the image to be recorded. The number of selected resistive heat elements is determined by the current to the printhead (26) or by counting the number of data bits and a signal representative of the number of selected resistive heat elements (44-1...44-N) is produced. The duration of the application of current to the selected resistive heat elements is adjusted responsive to the sensed voltage across resistive heat elements receives electrical current the selected print head. <IMAGE>
