Abstract (en)

[origin: EP0648916A1] Profile strip made from flexible sealing material, comprising two flat side parts connected by an open hollow channel. The hollow channel can have a U-shaped or polygonal, preferably rectangular, cross-section. The profile strip consists of a dimensionally stable, flexible material with good resistance to water, such as rubber, or of plastic, e.g. plasticised polyvinyl chloride, and can be reinforced by fibre or fabric inlays. It is preferably used in tunnelling for sealing the joints between adjacent lining elements. It is connected to the inside of the tunnel lining by adhesively bonding the flat side parts. The seepage water penetrating through the joint is directed through the hollow channel of the profile on both sides down to the sewers running along the tunnel. <IMAGE>
