Abstract (en)

THE DOMESTIC EXOTHERMIC REACTOR FOR THE COMBUSTION OF GAS OIL GASES incorporates two chambers. A cylindrical inner chamber formed by an element 1 and an outer chamber formed by such element 1 and the housing 4. The fuel arrives to the inner chamber and backs up at a concave bottom 2 where it evaporates due to the heat therefore producing an ascending flow which is interfered by two deflector rings 7 and 8. The upper ring supports a central element formed by two perforated plates 16 and 17, which in turn support the reticulated tubular elements 18, 19 and 20 ending on a head 24 and which warm the evaporating gases which initiate their combustion by means of the air supply to the outer chamber through an orifice 6 and which reaches the inner part of the reactor through rows of orifices 11, 12, 13, 14 and 15. The invention can be applied to industrial and domestic stoves. <IMAGE>
