Abstract (en)  
[origin: EP0648990A1] In a refrigerator, having a thermally insulating housing (11) which, together with a door (12) which is arranged on it so as to be closable, surrounds a cooling compartment cooled by an evaporator (15) and has, at its bottom (16), a plinth (13) which serves to receive refrigerator equipment, such as liquifier, condenser and the like, and in whose plinth space a recess (17) of the housing bottom (16) protrudes, into which recess a container (18) can be inserted for receiving products to be cooled, air guides are formed by means of the container (18) inserted in the recess (17) between the container walls (20) and the walls bounding the recess (17), as a result of which the cooling air is able to circulate around the container, a removably arranged tray (30) designed with closed walls being provided in the gap above the opening (19) of the container (18), with the aid of which tray a guide is formed for the cooling air towards the container and over its opening (19). <IMAGE>
