Abstract (en)

[origin: EP0649184A2] A semiconductor substrate having an integrated antenna element is mounted upside down on a carrier plate, which is highly thermally conductive, for an arrangement for radiating millimetric waves. For its part, this carrier plate is connected to a heat sink in a highly thermally conductive manner. A cavity resonator is constructed in the heat sink. The efficiency of the semiconductor component can be improved by the rapid dissipation of the heat lost from the semiconductor component, from the substrate into the heat sink. <IMAGE>
