Abstract (en)

[origin: WO9400703A1] The invention concerns a Bowden cable (4) with at least one core (8) enclosed in a sheath (7) and designed for the transmission of motion from one end to the other. In order to give a compact design, the invention proposes that separate motion-inducing elements (9, 11) at one end of the cable (4) engage with the core (8) and the sheath (7), by means of which motion pick-up elements (10, 13) associated with the other ends of the core and sheath, respectively, are independently moved.
