Abstract (en)  
[origin: WO9426367A1] In a device for setting wheels (4) in inline roller skates (1) wherein the axles of the wheels (4) pass through openings in a frame (3) and are mounted in an intermediate frame (6), where the inside width of the openings (14) in the frame (3) is greater than the outside diameter of the axles (7) and the intermediate frame (6) can be attached to the frame (3) at at least two different heights, the intermediate frame (6) can be set with positive and nonpositive attachment at at least two different heights by means of an insertion pin (10) which passes through the frame (3) and the free flanges of the intermediate frame (6), thus allowing a simple setting of at least some of the wheels at different heights on the frame without recourse to special tools.
