Abstract (en)

[origin: WO9401257A1] A device for cutting moving material webs, especially of fibrous materials, to shape comprises a rotating shape cutting roller and a rotating counter cutting roller. The shape cutting roller has a shape cutting side and the counter-roller a smooth surface. Both rollers are borne in a machine frame by means of rotary bearings and the center distance between them is adjustable. The rollers are rotatably fitted in separate first and second machine frame components which are supported on a shared machine base-frame. One of these machine frame components is fitted on an adjustable wedge guide to adjust the center distance between the rollers. Each machine frame component can be braced on the machine base-frame.
