Abstract (en)
[origin: EP0651226A1] The invention relates to a sighting device (aiming device) which contains a magnifying aiming telescope as the first sighting appliance. According to the invention, this sighting appliance, which is suitable for aimed firing, is supplemented by a further sighting appliance for rapid firing. This additional sighting appliance is an optical reflex sight which images a marker into the eye of the person using the sight and has a separate optical beam path, which is distinct from the aiming telescope. This reflex sight makes it possible to aim using one eye, it being possible for the other eye to remain open. <IMAGE>
