Abstract (en)

[origin: EP0652309A1] An impact element (12, 17) connected to a spring device (15) is pretensioned as a result of the advancing movement of the bobbin carrier rods (5) and, when a release position (23) is reached, relaxes in such a way that it emits a force pulse (I) in the direction of the nearest spindle (6) or a remaining bobbin (22) or empty tube (3) slipped on it. The impact element first transmits the force pulse to a loosely slipped-on impact disc (19) which can be used for different tube formats and which protects the remaining bobbins. <IMAGE>
